About This Document	Notes
Follow the instructions in this manual carefully to ensure safe and long-lasting use of the projector.	
Symbols used in this manual Many pages in this document have a dedicated area for notes. The information in that area is accompanied by the following symbols:	
WARNING: this symbol indicates that there is a danger of physical injury to yourself and/or damage to the equipment unless the instructions are closely followed.	
ELECTRICAL WARNING: this symbol indicates that there is a danger of electrical shock unless the instructions are closely followed.	
LIGHT HAZARD WARNING: this symbol indicates that there is a danger of exposure to intensive light that may result in personal injury unless the instructions are closely followed.	
LASER WARNING: this symbol indicates that there is a potential hazard of eye exposure to laser radiation unless the instructions are closely followed.	
NOTE: this symbol indicates that there is some important information that you should read.	
Product revision Because we at Digital Projection continually strive to improve our products, we may change specifications and designs, and add new features without prior notice.	
Updates may be available online - visit the Digital Projection website for all latest documents.	
Legal notice Trademarks and trade names mentioned in this document remain the property of their respective owners. Digital Projection disclaims any proprietary interest in trademarks and trade names other than its own.

Risk Group 3 Information

Light hazard warning

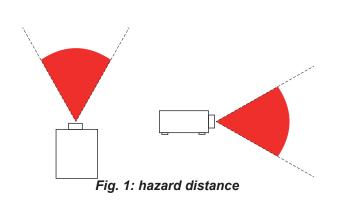

Failure to comply with the following may result in serious injury:

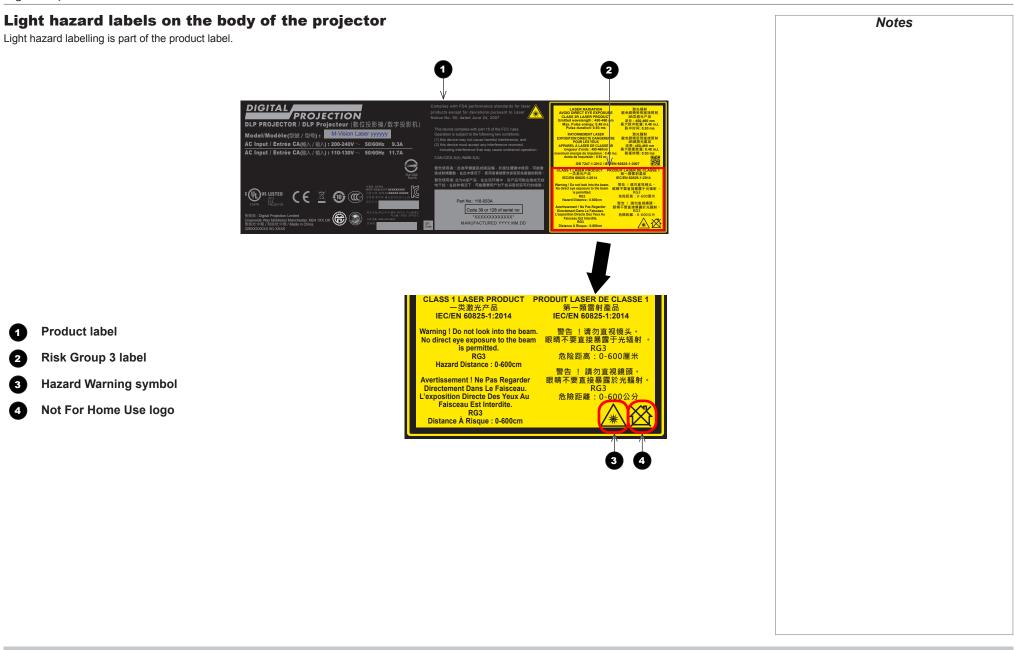

- No direct exposure to the beam is permitted, RG3 IEC 62471-5:2015.
- Operators control access to the beam within the hazard distance or install the projector at sufficient height to prevent exposures of spectators' eyes within the hazard distance.

The hazard distance (*Fig. 1*) is the distance measured from the projection lens at which the intensity or energy per unit of surface is lower than the applicable exposure limit on the cornea or skin. If the person is within the hazard distance, the beam is considered unsafe for exposure.

The hazard distance for this projector is 600 cm.

Notes

Laser Information

Caution - use of controls or adjustments or performance of procedures other than those specified herein may result in hazardous radiation exposure.

Notes

Introduction

Congratulations on your purchase of this Digital Projection product.

Your projector has the following key features:

- WUXGA native resolution projector delivering 18,000 ISO lumens.
- Support for Frame Sequential and Dual Pipe 3D formats as well as Frame Packed, Side-by-Side etc. formats.
- HDBaseT® for transmission of uncompressed High Definition Video up to 100 m from the source.
- 3G-SDI with loop-through.
- Blanking control for custom input window sizing.
- Edge Blending with black level correction.
- Cornerstone, Vertical & Horizontal Keystone, Pincushion & Barrel, and Image Rotation.
- Non-Linear warp for irregular projection surfaces.
- Separate control of screen and source aspect ratio.
- Contstant brightness mode maintains light output at selected levels.
- Control via LAN and RS232.
- Motorised lens mount.

A serial number is located on the side of the projector. Record it here:

Remote Control

1 Power ON / OFF

2

2

4

6

6

8

ി

Turns power on and off.

Pic Mute OPEN / CLOSED

Shows and hides the projected image. When CLOSED, the light source is completely switched off and the screen is black.

OSD ON / OFF

Enable and disable screen timeout messages and control whether to show the OSD during projection.

MENU

Access the OSD. If the OSD is open, press this button to go back to the previous menu.

Navigation (arrows and OK)

Navigate through the menus with the arrows, confirm your choice with **OK**. In lens adjustment modes, the arrows are used to move, zoom or focus the lens. See **11** below.

In lens adjustment modes, or when the OSD is not showing, the **OK** button switches between modes: *Shift Adjustment* and *Zoom / Focus Adjustment*.

EXIT

Go up one level in the OSD. When the top level is reached, press to close the OSD.

7 FREEZE

Freeze the current frame.

DEFAULT

INFO

When editing a parameter, press this button to restore the default value.

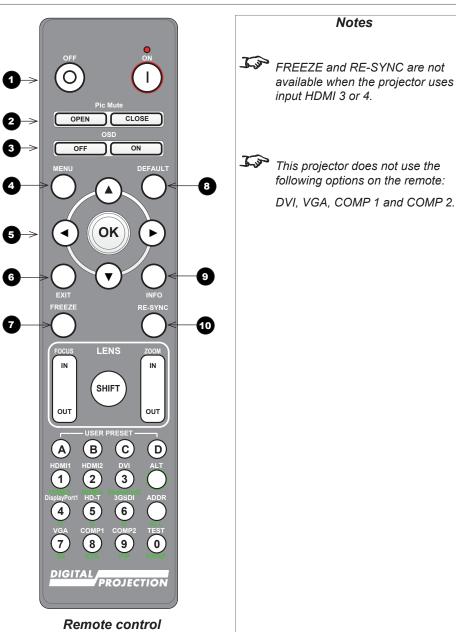

9

Access information about the projector.

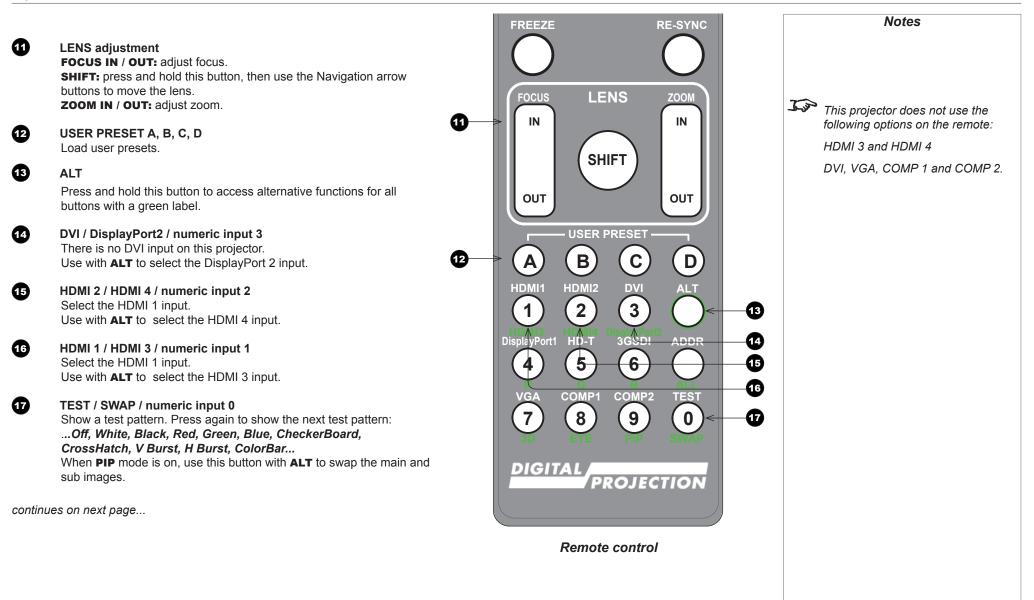

RE-SYNC

Re-synchronise with the current input signal.

B

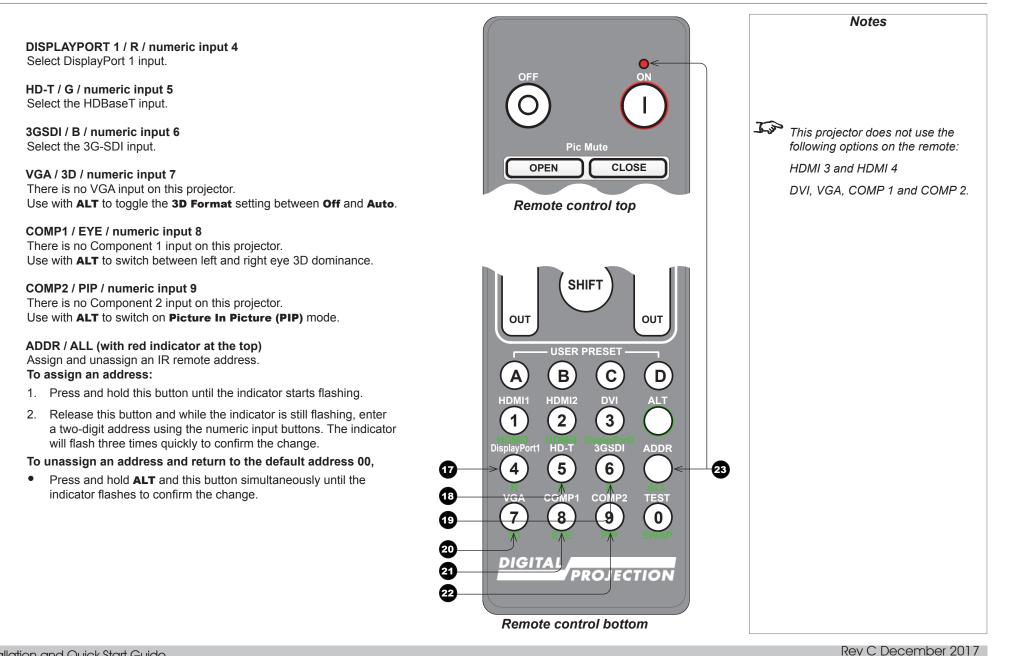

Ð

20

21

22

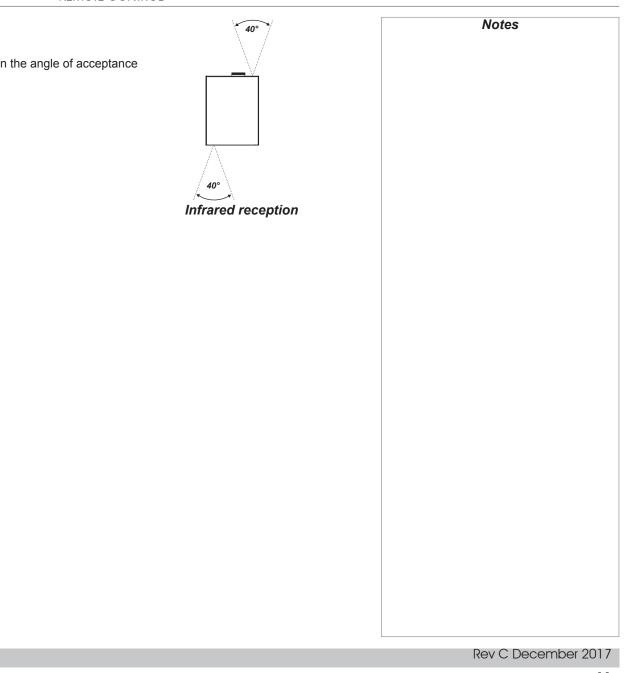

23

Infrared reception

The projector has infrared sensors at the front and back.

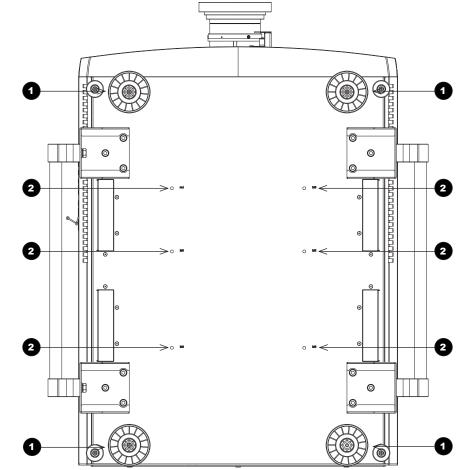

The angle of acceptance is 40°. Make sure that the remote control is within the angle of acceptance when trying to control the projector.

Positioning The Screen And Projector

- 1. Install the screen, ensuring that it is in the best position for viewing by your audience.
- 2. Mount the projector, ensuring that it is at a suitable distance from the screen for the image to fill the screen. Set the adjustable feet so that the projector is level, and perpendicular to the screen.

The drawing below shows the positions of the feet for table mounting, and the fixing holes for ceiling mounting.

Always allow the projector to cool for 5 minutes before disconnecting the power or moving the projector. Ensure that there is at least 50 cm (19.7 in) of space between the ventilation outlets and any wall, and 30 cm (11.8 in) on all other

Notes

sides.

Four adjustable feet

2

Six M6 holes for ceiling mount The screws should not penetrate more than 15 mm into the body of the projector.

Installation and Quick-Start Guide

Roll and pitch

The projector can be operated in any position, as shown in the illustration.

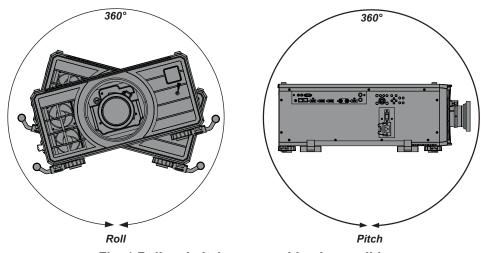

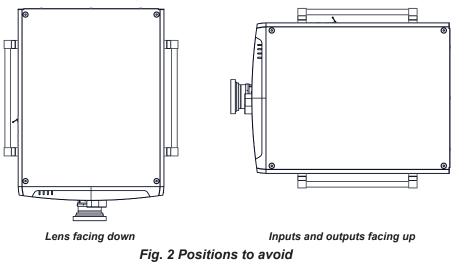

Fig. 1 Roll and pitch - any position is possible

However, the following positions are to be avoided as they can reduce motor life:

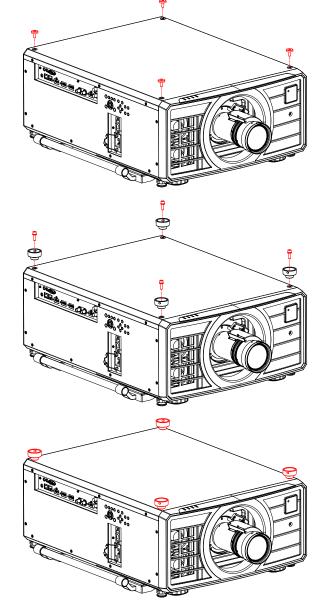

Notes

POSITIONING THE SCREEN AND PROJECTOR

Stacking instructions

1. On the bottom projector, remove the four screws on the top side. Insert and secure the stacking tops in their place.

Notes

When stacking projectors, the stack MUST be vertical, to ensure that the stresses are distributed to all four chassis corners.

Do not stack more than two projectors.

Do not use the provided eye bolts to suspend more than one projector. The eye bolts must not be used with stacks as they can carry the weight of one projector only.

Do not use the lifting handles when stacking. The handles will carry the weight of one projector only.

Use only the provided screws with a torque of 25-30 kgf cm (2.45 - 2.94 Nm).

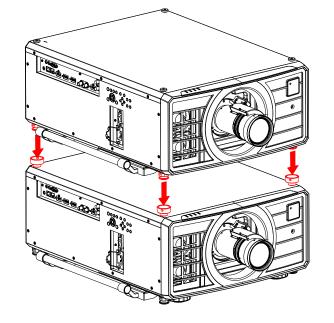

It is the customer's responsibility to ensure that the assembly is carried out securely.

The stacking kit is provided in the box as standard in some regions. It is also available to order separately.

POSITIONING THE SCREEN AND PROJECTOR

Stacking instructions continued

- 2. Remove the four adjustable feet of the top projector.
- 3. Slide the top projector over the bottom projector so the stacking feet are coupled with the stacking tops on the bottom projector.

Notes

When stacking projectors, the stack MUST be vertical, to ensure that the stresses are distributed to all four chassis corners.

Do not stack more than two projectors.

Do not use the provided eye bolts to suspend more than one projector. The eye bolts must not be used with stacks as they can carry the weight of one projector only.

Do not use the lifting handles when stacking. The handles will carry the weight of one projector only.

Use only the provided screws with a torque of 25-30 kgf cm (2.45 - 2.94 Nm).

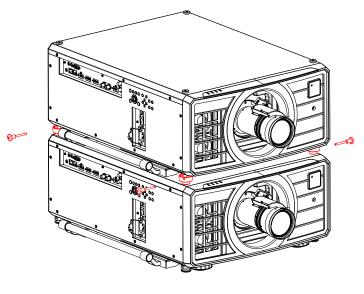

It is the customer's responsibility to ensure that the assembly is carried out securely.

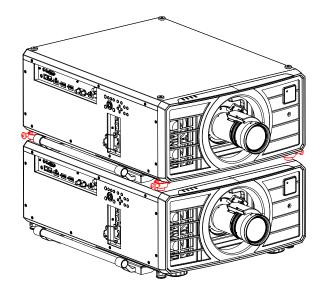

The stacking kit is provided in the box as standard in some regions. It is also available to order separately.

POSITIONING THE SCREEN AND PROJECTOR

Stacking instructions continued

4. Use the provided holding pins to secure each connection.

Notes

When stacking projectors, the stack MUST be vertical, to ensure that the stresses are distributed to all four chassis corners.

Do not stack more than two projectors.

Do not use the provided eye bolts to suspend more than one projector. The eye bolts must not be used with stacks as they can carry the weight of one projector only.

Do not use the lifting handles when stacking. The handles will carry the weight of one projector only.

Use only the provided screws with a torque of 25-30 kgf cm (2.45 - 2.94 Nm).

It is the customer's responsibility to ensure that the assembly is carried out securely.

The stacking kit is provided in the box as standard in some regions. It is also available to order separately.

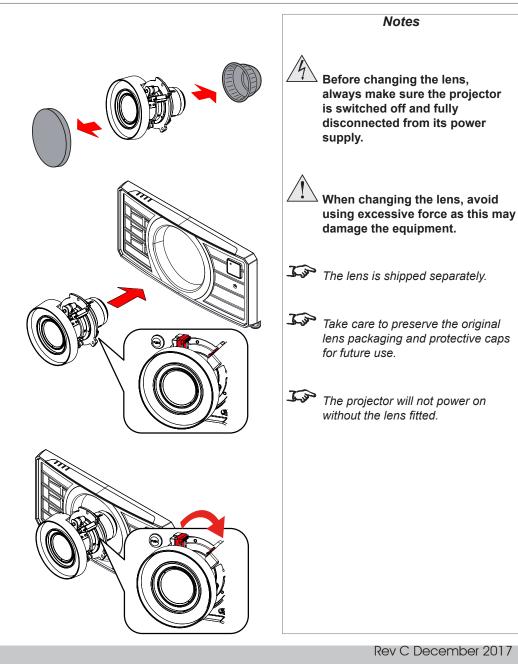

Changing The Lens

Inserting a new lens

1. Remove the front and rear lens caps.

2. Insert the lens, keeping the connector in upright position.

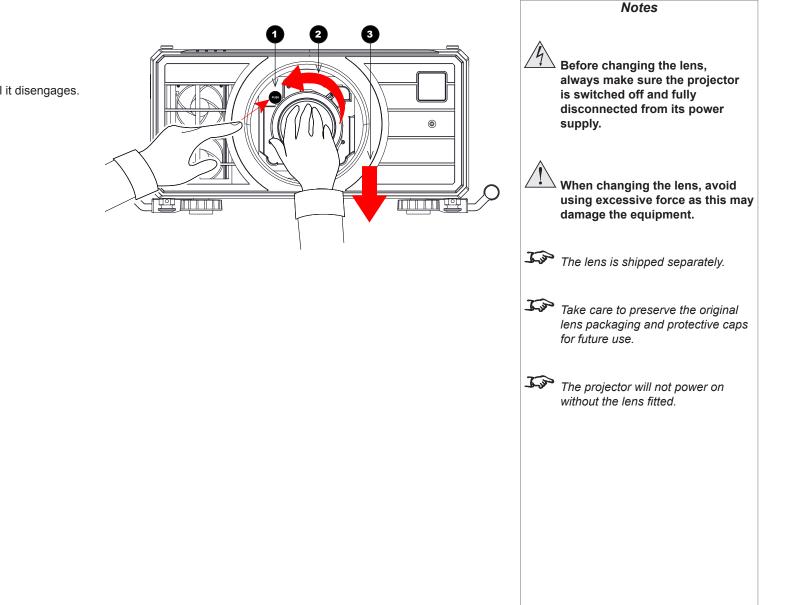

3. Rotate the lens clockwise until it clicks into place.

Notes

- 1. Push *the button* 1 all the way in.
- 2. Rotate the lens *counterclockwise* 2 until it disengages.
- 3. Slowly *pull the lens out* **3**.

Operating The Projector

Switching the projector on

- 1. Ensure a lens is fitted. Connect the power cable between the mains supply and the projector. (See *Connecting the power supply* above.) Switch on at the switch next to the power connector.
- 2. The **POWER** indicator lights red to signal that the projector is in STANDBY mode. Press one of the following buttons:
 - On the remote control, the **ON** button
 - On the projector control panel, the **POWER** button.

The fans begin working, then the **POWER** indicator begins flashing green. When the flashing stops, the **POWER** and **LIGHT** indicators both light steady green. The projector is switched on.

Switching the projector off

1. Press OFF on the remote control or POWER on the control panel, then press again to confirm your choice.

The **POWER** indicator on the control panel will start flashing amber, the system will go out and the cooling fans will run for a short time until the **POWER** indicator goes steady red to indicate that the projector has entered STANDBY mode.

2. If you need to switch the projector off completely, switch off at the mains power switch next to the power connector and then disconnect the power cable from the projector.

	Notes
L'ar L'ar	See also Connecting The Power Supply earlier in this guide. The self-test is running when all the LEDs on the control panel are lit.
Â	Use only the power cable provided.
4	Ensure that the power outlet includes a ground connection as this equipment MUST be earthed
<u>A</u>	Handle the power cable carefully and avoid sharp bends. Do not use a damaged power cable.

Selecting an input signal

- 1. Connect one or more image sources to the projector.
- 2. Select the input you want to display:
 - Press one of the input buttons on the remote control. •
 - Alternatively, open the On-screen display (OSD) by pressing MENU. Highlight Input from the main menu, press ENTER/OK and then ٠ select an input signal using the UP A and DOWN V arrow buttons. Press ENTER/OK to confirm your choice.

Selecting a test pattern

To display a test pattern:

Press TEST on the remote control.

Change the test pattern using the LEFT < and RIGHT > arrow buttons. Test patterns are displayed in the following order:

White, Black, Red, Green, Blue, Checkerboard, CrossHatch, V Burst, H Burst, ColorBar, Aspect Ratios, Off

Alternatively, open the OSD by pressing MENU. Highlight Test Patterns from the main menu, then select a test pattern using the LEFT • and **RIGHT** arrow buttons.

After the final test pattern, the projector exits test pattern mode and returns to the main image. To view test patterns again, you need to press TEST again. If you wish to exit the test patterns before you reach the final one,

۲ press TEST or EXIT at any time.

Notes
For full details of how to use the controls and the menu system, see the Operating Guide .

3

EDID on the DisplayPort, HDMI and HDBaseT inputs

If you are using a computer graphics card or another source that obeys the EDID protocol, the source will automatically configure itself to suit the projector.

Otherwise refer to the documentation supplied with the source to manually set the resolution to the DMD[™] resolution of the projector or the nearest suitable setting. Switch off the source, connect to the projector, then switch the source back on again.

Using DisplayPort/HDMI/HDBaseT switchers with the projector

When using a DisplayPort/HDMI/HDBaseT source switcher with the projector, it is important to set the switcher so that it passes the projector EDID through to the source devices. If this is not done, the projector may not be able to lock to the source or display the source correctly as its video output timings may not be compatible with those of the projector. Sometimes this is called transparent, pass-through or clone mode. See your switcher's manual for information on how to set this mode.

The EDIDs in the switcher should be the same as the one in the projector.

Notes

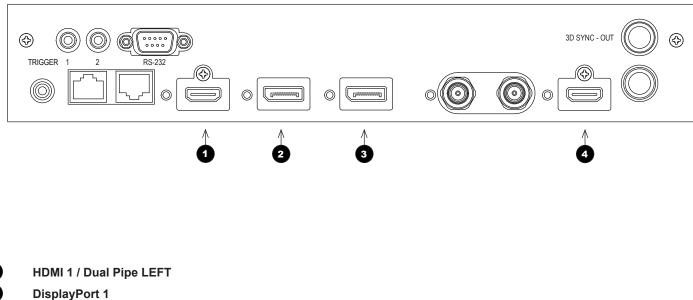

3D connections

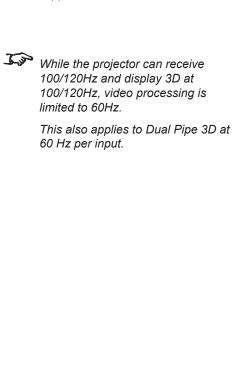

Frame sequential 1080p and WUXGA 3D sources at 100 and 120 Hz

- 1. Connect to a DisplayPort input.
- 2. Set **3D Format** in the **3D** menu to **Frame Sequential**.

Dual Pipe 1080p, WUXGA and WQXGA 3D sources at 100 and 120 Hz

- 1. Connect the left eye output to the HDMI 1 socket and the right eye output to the HDMI 2 socket.
- 2. Set 3D Format in the 3D menu to Dual-Pipe.

Notes

See <u>3D formats</u> in the **Reference Guide** for a complete list of

supported formats and frame rates.

DisplayPort 2

HDMI 2 / Dual Pipe RIGHT

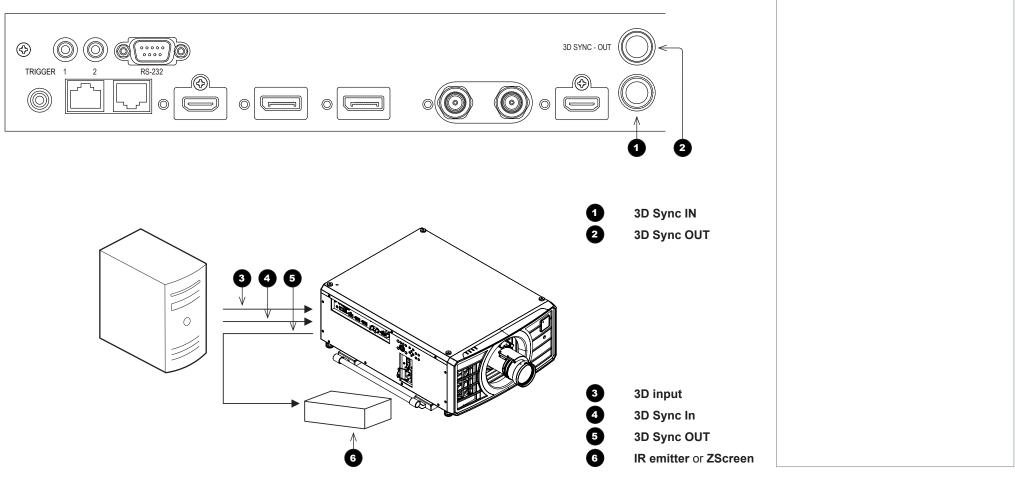

3D Sync

3D Sync In

Sync input signal. Connect the 3D sync from your graphics card or server.

3D Sync Out

Sync output signal. This may be affected by the **Sync Offset** setting in the **3D Control** menu. Connect this to your IR emitter or ZScreen.

Rev C December 2017

Control Connections

Trigger 1

Trigger 2

1

2

3

4

5

6

The Trigger outputs are activated by one of the three following conditions, as set in the **Setup** menu:

- Screen trigger: can be connected to an electrically operated screen, automatically deploying the screen when the projector starts up, and retracting the screen when the projector shuts down.
- Aspect ratio trigger: can be used to control screen shuttering for different aspect ratios.
- RS232 trigger: can be used to control the screen or screen shuttering on receipt of an RS232 command

RS232

- All of the projector's features can be controlled via a serial connection, using commands described in the *Protocol Guide*.
- Use a straight-through cable to connect directly to a computer.

Wired Remote

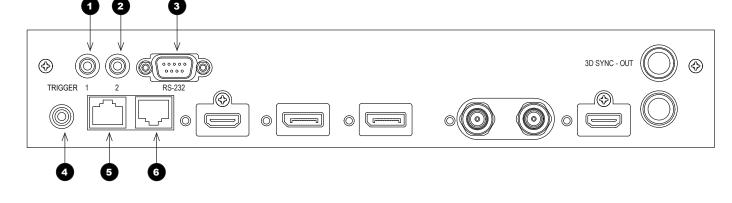

The remote control can be connected using a standard 3.5 mm mini jack cable (tip-ring-sleeve, or TRS).

LAN

This dedicated LAN connection can be used if HDBaseT/LAN is already being used for HDBaseT signal input.

HDBaseT/LAN

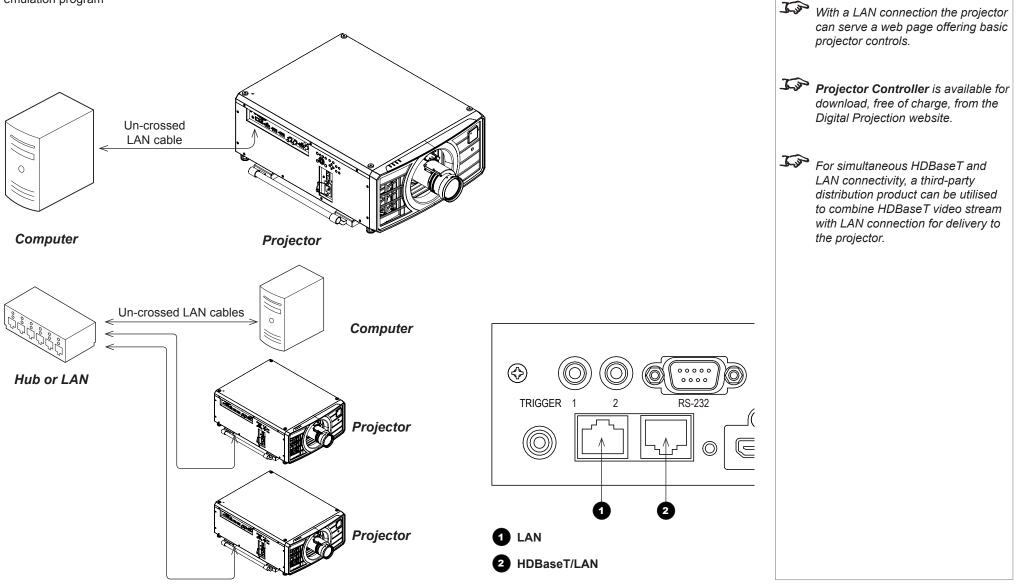

The projector's features can be controlled via a LAN connection, using Digital Projection's *Projector Controller* application or a terminal-emulation program.

For a list of all commands used to control the projector via LAN, see the Protocol Guide. **Solution** Only one remote connection (RS232 or LAN) should be used at any one time. Jan With a LAN connection the projector can serve a web page offering basic projector controls. Jan Trigger 1 and Trigger 2 are not available with HDMI 3 and 4 inputs. Jan Projector Controller is available for download, free of charge, from the Digital Projection website.

LAN connection examples

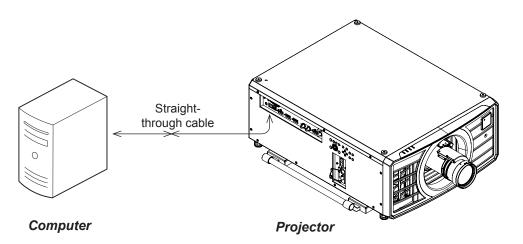

The projector's features can be controlled via a LAN connection, using Digital Projection's **Projector Controller** application or a terminalemulation program

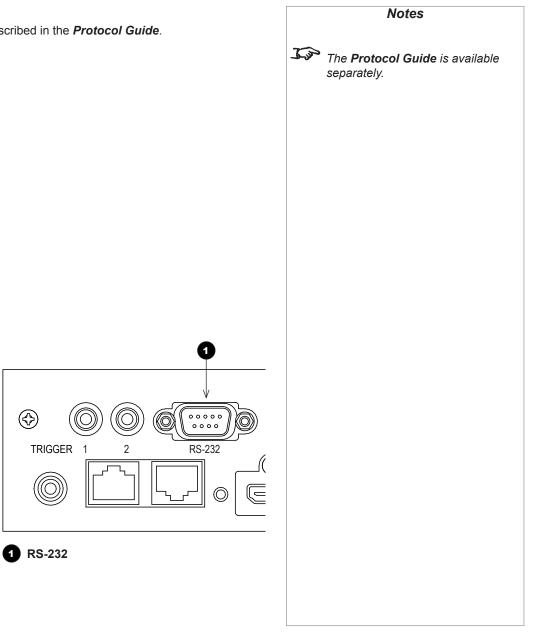

Connection Guide

All of the projector's features can be controlled via a serial connection, using commands described in the Protocol Guide.

Using The Menus

Opening the OSD

Access the various menus using either the projector control panel or the remote control. On either device,

• press the **MENU** button.

The on-screen display (OSD) opens showing the list of available menus.

Opening a menu

Move up and down the list using the **UP**▲ and **DOWN** ▼ arrow buttons. To open a menu,

• press **ENTER** on the control panel or **OK** on the remote control.

This guide refers to the above two buttons as **ENTER/OK**.

Exiting menus and closing the OSD

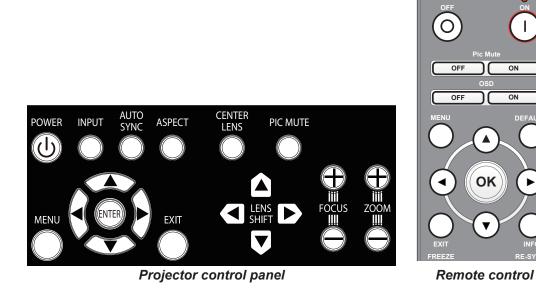

To go back to the previous page,

• press EXIT.

When you reach the top level, pressing **EXIT** will close the OSD.

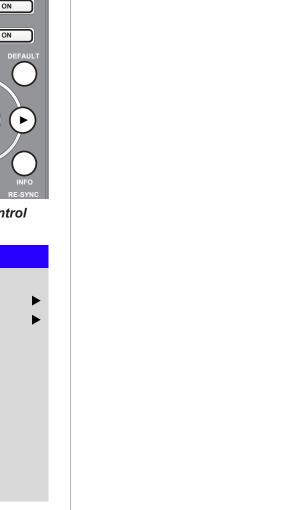

To close the OSD from any page,

• press MENU.

USING THE MENUS

Inside a menu

When you open a menu, the page consists of the following elements:

- Title bar at the top Shows which menu you have accessed.
- Highlighted item
- Available and unavailable items Unavailable items appear a pale gray color. Whether an item is available may depend on other settings.
- The text or symbol to the right of an item shows whether the item:
 - has a value that can be changed (the current value is shown)
 - opens a sub-menu (an arrow button ▶ is displayed)
 - executes a command (the space to the right of the item is blank).

Accessing sub-menus

Use the UP \blacktriangle and DOWN \blacktriangledown arrow buttons to highlight the sub-menu, then press ENTER/OK.

Executing commands

If the item contains a command, highlighting it reveals an **OK** button.

Press ENTER/OK to execute the highlighted command.

You may be asked for confirmation. Use the ENTER/OK to confirm, or EXIT to cancel.

Men	u Name		Notes
Highlighted Item Menu Item Unavailable Item Slider Sub-menu Command	Value Value Value	•	The highlighted item has green background.

Menu Item	Value		
Highlighted Commar Highlighte	nd ed command	ΟΚ	
Comm	and Name		
WARNING All [Menu] values will			
Press OK to Press Exit t	confirm		
Confirm	ation dialog		

Editing projector settings

If the highlighted menu item contains a list of values to choose from, you can change the value by doing the following:

- 1. Highlight the menu item and press ENTER/OK.
- 2. In the list of values that opens, use the **UP** ▲ and **DOWN** ▼ arrow buttons to highlight a value, then press **ENTER/OK** again to select the highlighted value.

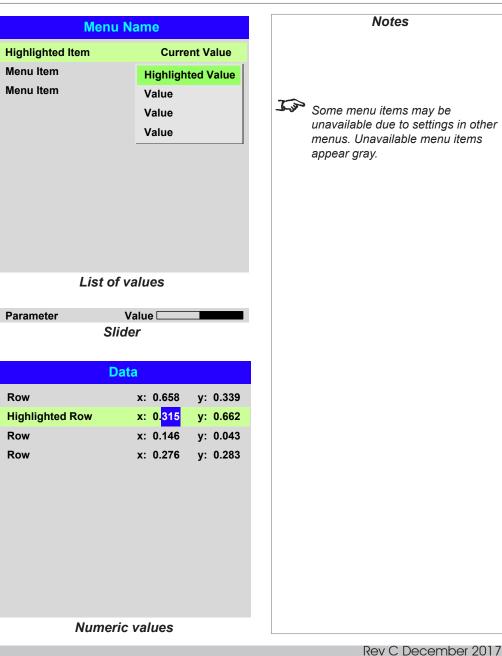

Some parameters open a slider. To set such a parameter:

- 2. Use the **LEFT 4** and **RIGHT b** arrow buttons to move the slider.
- 3. When ready, press **EXIT** to exit the slider and return to the menu, or press **MENU** to exit the slider without showing the menu again.

Editing numeric values

Some parameters take numeric values without using sliders - for example, color matching values or IP addresses.

- 1. Use the **UP** \blacktriangle and **DOWN** \checkmark arrow buttons to highlight the row containing the numeric field you wish to edit.
- 2. Press **ENTER/OK** to enter edit mode. A numeric field in edit mode is white text on blue background.
- 3. In edit mode:
 - Use the **UP** ▲ arrow button to increase the numeric value.
 - Use the **DOWN** ▼ arrow button to decrease the numeric value.
- 4. Use the **LEFT** ◀ and **RIGHT** ► arrow buttons to edit the next or previous numeric fields within the same row.
- 5. Once ready, press ENTER/OK to exit edit mode.

Operating Guide

Using The Projector	Main Menu	Notes
 Main menu Input Press ENTER/OK to open the list of available inputs. Use the UP ▲ and DOWN ▼ arrow buttons to select an input from the list, then press ENTER/OK to confirm your choice. Press EXIT to return to the main menu. Test Pattern Choose from: Off, White, Black, Red, Green, Blue, Cyan, Yellow, Magenta Use the LEFT ◄ and RIGHT ► arrow buttons to switch between values. Lens, Image, Color, Geometry, Edge Blend, 3D, Laser, Setup and Network Press ENTER/OK to open these menus and access various settings. 	Input HDMI 1 Test Pattern Lens Image Color Geometry Edge Blend 3D Laser Setup Network	See <u>Signal Inputs</u> in the Connection Guide for further information about the available inputs and connections.
Press the DOWN v arrow at the bottom of the page to access additional menus:	Main Menu	
• PIP and Information Press ENTER/OK to open these menus and access various settings.		
	Information	

Press the **UP** \blacktriangle arrow to return to the previous page.

Lens menu

• Lens Lock

When this feature is **On**, all other **Lens** menu items are disabled.

• Lens Control

Opens a sub-menu, see below.

Center Lens

Centers the lens.

• Lens Memory

Opens a sub-menu, see next page.

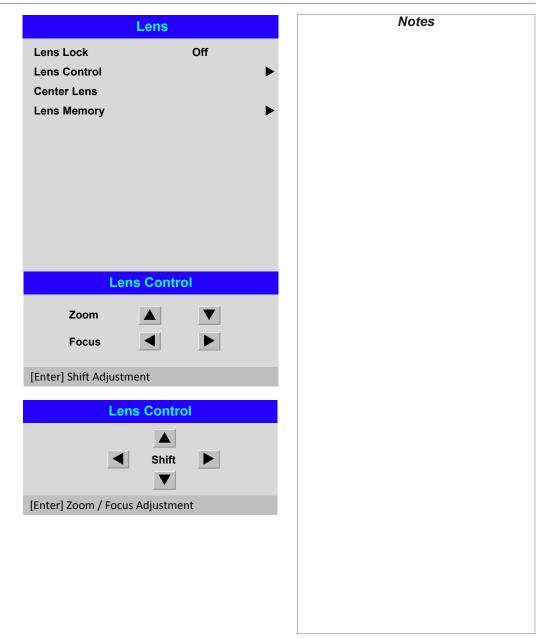

Lens Control

Lens Control settings operate in Zoom/Focus Adjustment and Shift Adjustment mode. Press ENTER/OK to switch between modes.

When in Zoom/Focus Adjustment mode:

- Use the **UP** ▲ and **DOWN** ▼ arrow buttons to adjust **Zoom**.
- Use the **LEFT d** and **RIGHT b** arrow buttons to adjust **Focus**.

When in Shift Adjustment mode, use the arrow buttons to adjust Shift.

Operating Guide

Lens menu continued from previous page

Lens Load Memory

Lens Memory

This menu allows you to load, save and delete up to ten lens presets, containing position, zoom, focus and shift adjustment information.

For example, if using different screen sizes and aspect ratios, you can save zoom, focus and positioning for each screen size and aspect ratio in a dedicated preset.

Use **Clear Memory** to delete a memory preset if you need to save a new combination of lens settings in its place. Overwriting a saved memory preset is not possible.

Choose from High Bright, Presentation and Video.

Use a different setting depending the type of input source. Press ENTER/SELECT to open the list. Use the UP ▲ and DOWN ▼ arrow buttons to select a picture mode from the list, then press ENTER/OK to confirm your choice. Press EXIT to return to the main menu.

• Dynamic Black

Set to **On** to allow for increased contrast in darker scenes by modulating the light source.

• Light Off Timer

When Dynamic Black is **On**, the Laser light source may turn off depending upon the setting of the **Light Off Timer**. Options are: Disable, 0.5, 1.0, 1.5, 2.0, 3.0, 4.0 seconds.

• Gamma

Choose a de-gamma curve from **1.0**, **1.8**, **2.0**, **2.2**, **2.35**, **2.5**, **S-Curve** and **DICOM**. Used correctly, the **Gamma** setting can improve contrast while maintaining good details for blacks and whites.

If excess ambient light washes out the image and it is difficult to see details in dark areas, lower the **Gamma** setting to compensate. This improves contrast while maintaining good details for blacks. Conversely, if the image is washed out and unnatural, with excessive detail in black areas, increase the setting.

S-Curve is an enhanced mid-tone gamma.

DICOM is a simulated DICOM display, which can be used for training applications.

Brightness, Contrast, Saturation, Hue, Sharpness, Noise Reduction

Highlight the setting you wish to edit, and then press **ENTER/OK**, or the **LEFT** ◀ or **RIGHT** ► arrow button to open the slider.

Use the **LEFT** \blacktriangleleft and **RIGHT** \blacktriangleright arrow buttons to adjust the slider. Press **EXIT** to close the slider and return to the menu, or **MENU** to close the slider and return to the projected image.

• Freeze

Freezes the current frame.

Resync

Press ENTER/OK to force the projector to resynchronise with the current input.

	Image
Picture Mode	High Bright

Gains and Lifts	RGB Video	
	RGB Video	

USING THE PROJECTOR

Color Mode

The projector can work in the following color modes: ColorMax, Manual Color Matching, Color Temperature and Gains and Lifts.

ColorMax

1. Set Color Mode to ColorMax.

2. Navigate to the ColorMax setting. Choose from HDTV, Peak, User 1 and User 2.

User 1 and User 2 are user-defined color gamuts set via the Setup > ColorMax menu.

See Setup menu for further information about setting up the User 1 and User 2 color gamuts.

Cold	or menu continued from previous pa	ge						Notes
1. 3	ual Color Matching Set Color Mode to Manual Color Matching.			Manual Cole	or Matching Off			
2.	 Open the Manual Color Matching submenu. Here you can do the following: Switch Auto Test Pattern On and Off. Adjust Hue, Saturation and Gain settings for each individual color to improve the color balance of the projected 			Red Green Blue Yellow Cyan Magenta White Balance Reset		* * * * * *	<u>t</u>	For more details about the Hue, Saturation and Gain settings, see Color matching parameters explained further in this guide.

Color menu continued from previous page

Color matching parameters explained

The levels of hue, saturation and gain in the **Manual Color Matching** menu change the color values in the following ways:

1 Hue

2

3

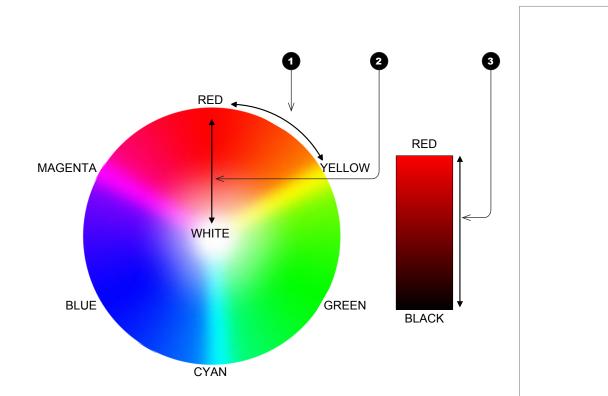

Specifies the position of each color (*red*, *yellow*, *green*, *cyan*, *blue* and *magenta*) relative to its neighboring colors.

Saturation

Specifies the level of white in each color (i.e. how "pale" each color is).

Gain

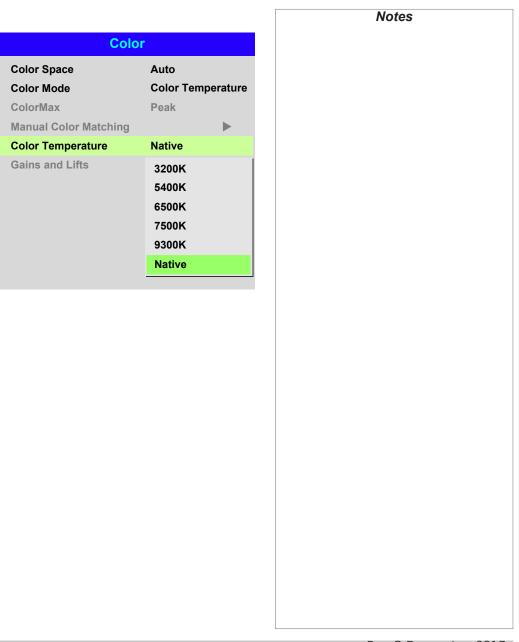

Controls the amount of light that goes into each color, i.e. the lowest gain would produce black.

Color menu continued from previous page

Color Temperature

- 1. Set Color Mode to Color Temperature.
- 2. Navigate to the **Color Temperature** setting. Choose a value from **3200K** (warmer) to **9300K** (cooler) or **Native** (no correction).

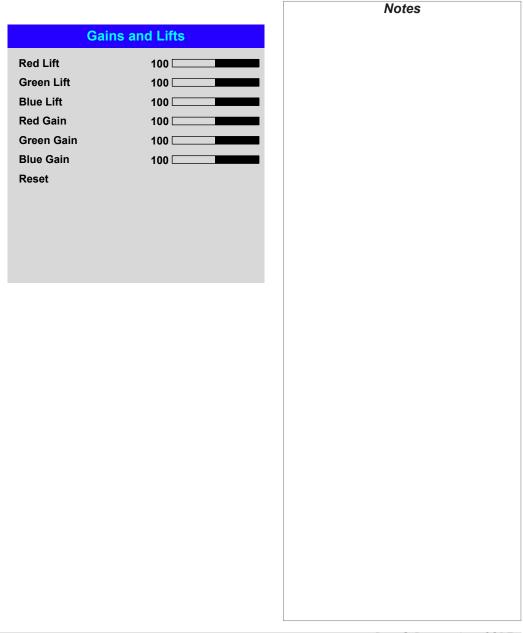

Color menu continued from previous page

Gains and Lifts

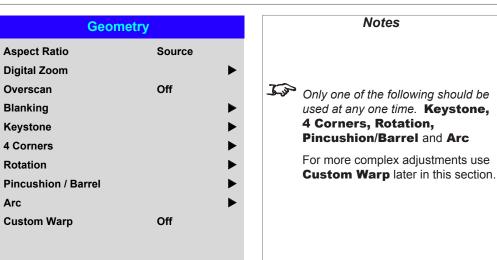

Lifts allow you to adjust black levels of individual colors, while gains adjust the bright part of the scale.

Set the sliders as required.

Geometry menu

This menu allows you to compensate for image distortions caused by an unusual projection angle or irregular screen surface.

Aspect Ratio

This feature defines the aspect ratio of the source. Use the Setup > Screen Setting to define the screen aspect ratio.

If you choose a preset aspect ratio from here, it will give you the best fit for your selection.

Choose from:

- 5:4
- 4:3
- 16:10
- 16:9
- 1.88
- 2.35
- TheaterScope
- Source
- Unscaled

J Image scaling and aspect ratio are also influenced by Setup > Screen Setting.

Notes

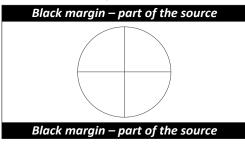

See next page for further information about the TheaterScope aspect ratio.

USING THE PROJECTOR

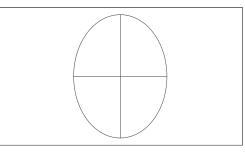

Theaterscope setting

The **TheaterScope** setting is used in combination with an anamorphic lens to restore 2.35:1 images packed into a 16:9 frame. Such images are projected with black lines at the top and bottom of the 16:9 screen to make up for the difference in aspect ratios.

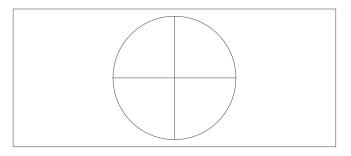

Without an anamorphic lens and without the TheaterScope setting applied, a 16:9 source containing a 2.35:1 image looks like this:

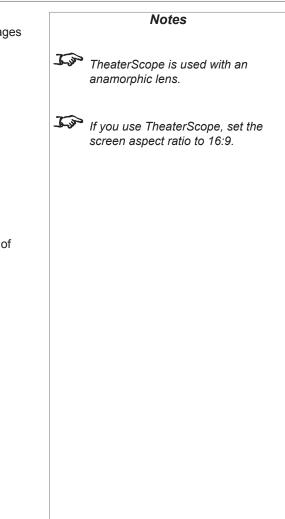

If we change the setting to **TheaterScope**, the black lines will disappear but the image will stretch vertically to reach the top and bottom of the DMD™:

An anamorphic lens will stretch the image horizontally, restoring the original 2.35 ratio:

		Notes
Digit	al Zoom	
Digital Zoom	0	
Digital Pan Digital Scan	0	
Reset		
	Digital Zoom Digital Pan Digital Scan	Digital Pan 0 Digital Scan 0

Overscan

Use this setting to compensate for noisy or badly defined image edges.

Crop removes unwanted artifacts from the edges of your image by cropping the edges. **Zoom** increases the size of the image to force the edges off-screen.

Overscanned image

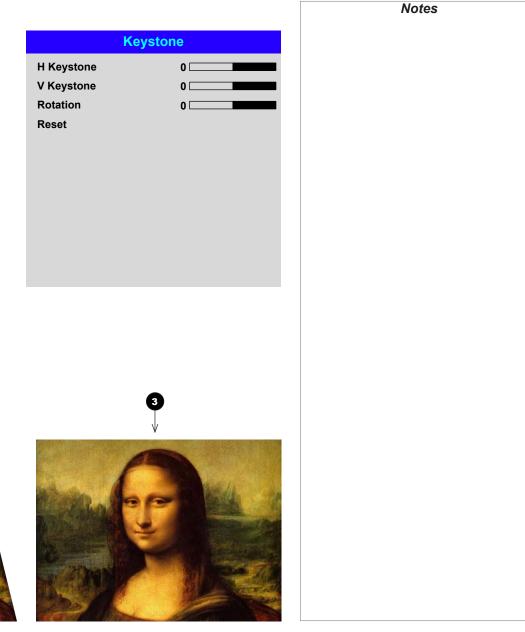

Image with noisy edges

Geometry menu continued from previous page		
Blanking Use this feature to:	Blanki	ng
• fit an odd-sized screen;	Тор	0
 cut off timecode dots in the top line of a picture; 	Bottom	0
• cut off subtitles, etc.	Left Right	0
Select the edge you wish to blank and use the LEFT < and RIGHT > arrow buttons to determine the amount of correction.	Reset	0
Use the Reset command to restore blanked edges.		

Keystone

Use this setting to compensate for any distortion caused by the projector being in a different horizontal or vertical plane to the screen.

Keystone example

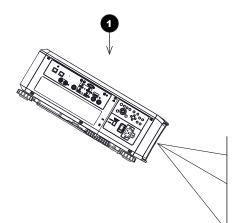

0

2

3

The projector is positioned at an angle

- The resulting image is distorted
- The image is corrected when Keystone is applied

2

Keystone settings

a

3

4

Projector to the left The projector is positioned to the left of the screen. To correct, apply a positive Horizontal Keystone value using the **RIGHT** arrow button.

Projector to the right The projector is positioned

to the right of the screen. To correct, apply a negative **Horizontal Keystone** value using the **LEFT** arrow button.

Projector high The projector is positioned above the screen at a downward angle. To correct, apply a negative Vertical Keystone value using the DOWN arrow button.

1

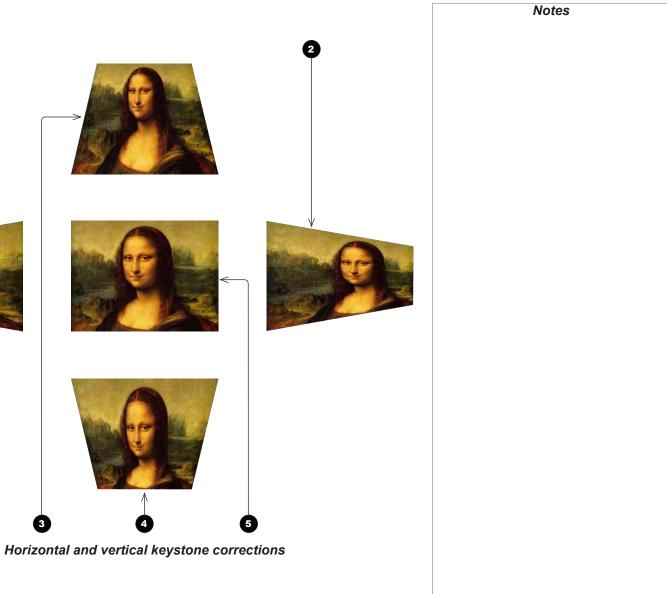

The projector is positioned below the screen at an upward angle. To correct, apply a positive **Vertical Keystone** value using the **UP** arrow button.

6

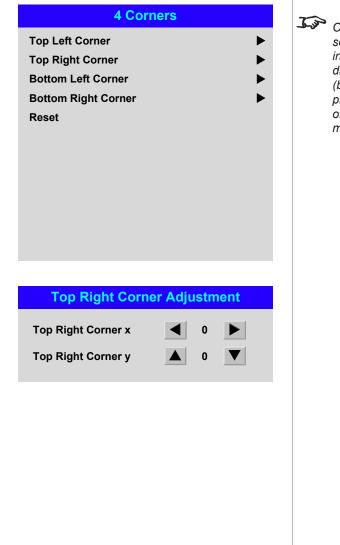

The projector is directly opposite the screen at a right angle both horizontally and vertically. No correction is needed.

Projector straight

4 Corners

For each corner, apply horizontal and / or vertical correction as necessary to restore the rectangular shape of the image.

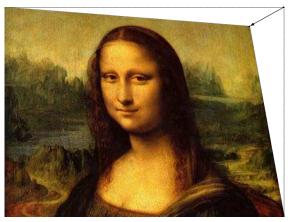

Corner corrections provide a simple setup for awkward installations and irregular shaped screens that may distort the image. To apply a similar (but less flexible) correction, while preserving the original aspect ratio of the image, use the **Keystone** menu.

Notes

Top Right Corner example

In this illustration, the top right corner requires both horizontal and vertical correction.

Top Right Corner COrrection

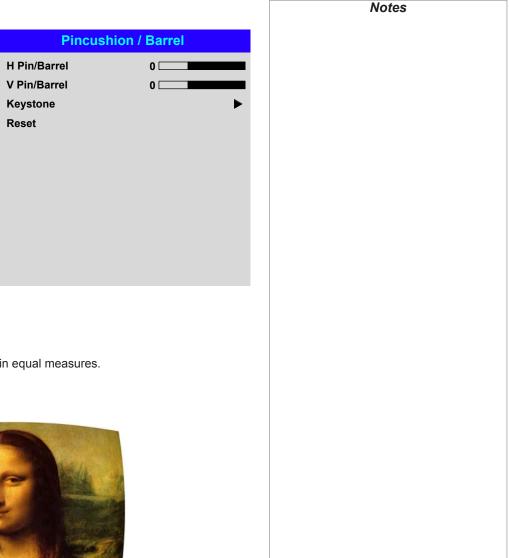

Geometry menu continued from previous page		Notes
Rotation Use this feature for example to correct a mounting error causing the image not to be level with the screen.	Rotation 0	
Rotation example	Reset	
DMD [™] area The DMD [™] is not rotated. It still covers the area that would be occupied by the image without correction.		
2 Rotated image The image is smaller than the surrounding DMD [™] area. It is scaled in order to remain within the DMD [™] area.		
3 Angle of rotation The angle equals a quarter of the Rotation setting. In this example the angle is 5°, therefore Rotation = 20 .		
Operating Guide		Rev C December 2017

Pincushion / Barrel

Pincushion or barrel distortions are the result of poor or incorrect tensioning of the screen or using a surface that is not flat.

Use the **Pincushion** / **Barrel** control to compensate electronically for such distortions.

You can also use this menu to make simple panoramic screen corrections without using external processors.

Pincushion / Barrel example

The illustration shows pincushion and barrel correction applied both horizontally and vertically, in equal measures.

Pincushion

Barrel

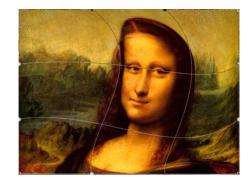

Operating Guide

Arc

This feature is similar to **Pincushion** / **Barrel** but allows you to apply curvature to each edge of the image independently so you can have any combination of corrections.

Custom Warp

Settings User 1 and User 2 are selections of user created predownloaded custom warp maps.

Arc		Notes	
Top Bottom Left Right Reset		Please note that a positive Arc value on any edge will reduce the image size as the projector needs to maintain the aspect ratio. A negative Arc value will not affect the overall image size.

The Projector Controller software is available for download from the Digital Projection website, free of charge.	

USING THE PROJECTOR

Edge Blend menu

Use this menu to blend together images from an array of two or more projectors.

The feature feathers the light output of the projector within the edges that overlap with other projectors in the array: as a result, the overlapping edges are evenly lit and easily blend in with the rest of the image.

• Edge Blend Enable and disable Edge Blend

• Align Pattern

Add markers to the image showing the edges of the blend area and making the overlaps more visible to help adjust the physical position of the projectors in the array.

• Blend Width

Determine the width of the blended regions.

• Black Level Uplift

Adjust black levels to compensate if the blended regions appear brighter than the rest of the image.

• Reset

Reset all Edge Blend settings to their factory default values.

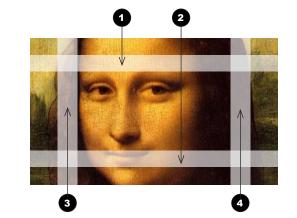

Edge Blend		Notes		
Edge Blend Align Pattern Blend Width Black Level Upl	On Off	*	<u>L'a</u>	When Edge Blend is set to Off , all other edge blend settings are disabled.
Reset			<u>L</u>	The picture in the blend region needs to be delivered to all overlapping projectors, which may require a special setup of the source.

Edge Blend menu continued from previous page

Blend Width

Use the **LEFT d** and **RIGHT b** arrow buttons to set the width of the blended regions:

Top
 Bottom
 Left
 Right

		Notes	
BI	end Width		
Гор Bottom	0		
Left Right	0		

Operating Guide

Edge Blend menu continued from previous page

Black Level Uplift

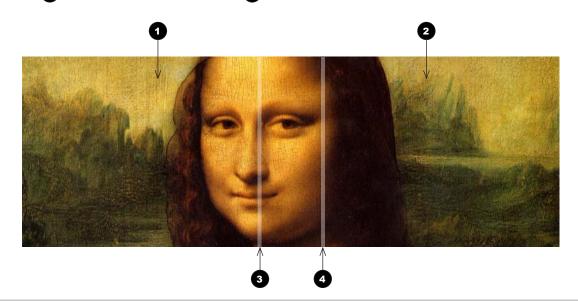

Black in the blended regions appears less dark than in the rest of the image. To compensate for this, use this menu to raise the black levels of the rest of the image:

- Set **All** to the required amount of black level correction. This will apply equal correction to the black levels of all colors.
- If necessary, use the individual color sliders (**Red**, **Green** and **Blue**) for fine adjustment.

You may experience artifacts at the edges where the blended region of one projector overlaps the *pond of mirrors* of its neighbor. In the example below, the blended image comes from *two projectors*, 1 and 2. Both images have black level uplift applied; as a result, *artifacts* 3 and 4 have emerged at the edges where the black level uplift region of one projector overlaps the pond of mirrors of the other.

To remove the artifacts, you need to slightly reduce the size of the black level uplift region of each projector so it does not overlap the pond of mirrors of the other projector.

Depending on your array, use Top, Bottom, Left and/or Right to reduce the black level uplift size. In the example below, use the Right slider of the projector on the left 1 to remove the artifact on the right 4, and the Left slider of the projector on the right 2 to remove the artifact on the left 3.

Notes

USING THE PROJECTOR

3D menu

Use this menu to enable, disable and set up 3D input, as follows:

• 3D Format — Off, Auto, Side-bySide (half), Top and Bottom, Dual Pipe and Frame Sequential.

Frame Sequential is displayed at the incoming rate whereas **Dual Pipe** is for sources where Left and Right eye are delivered on separate inputs.

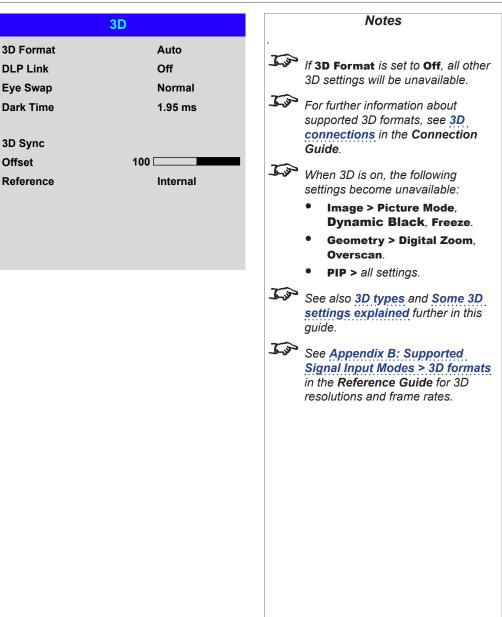

• DLP Link — Off / On.

DLP Link On emits a sync pulse for the 3D glasses via the projected image. **DLP Link Off** will send the sync pulse to the sync out connector to use with an external third party emitter.

- Eye Swap Normal and Reverse (set to Reverse if the left- and right-eye images are displayed in the wrong order)
- **Dark Time 0.65 ms**, **1.3 ms** and **1.95 ms**. Set to reduce the effect of banding and image overlapping when viewed through 3D the glasses.

3D Sync

- Offset use the LEFT ◀ and RIGHT ► arrow buttons to compensate for image overlappng (ghosting) when viewed through 3D glasses.
- Reference— External and Internal. This is information only.

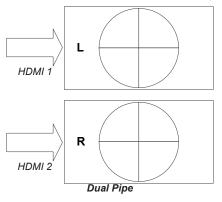

3D types

In most situations you can use the **Auto** setting to have the projector automatically detect the format. Otherwise, consider the notes below to help you set up the 3D input manually.

The following 3D formats are supported:

• Dual Pipe (LEFT and RIGHT)

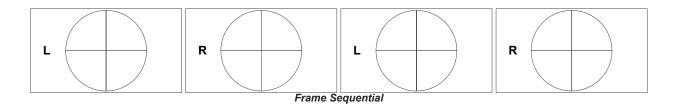

The left and right eye images are delivered on two separate HDMI links, which the projector will interleave for 3D display.

Frame Sequential

Displayport and HDMI inputs can accept **Frame Sequential** formats where both left and right eye images are delivered on a single cable. Up to 120Hz can be received and displayed. Frames rates of 50Hz or 60Hz will be displayed at 100Hz or 120Hz respectively.

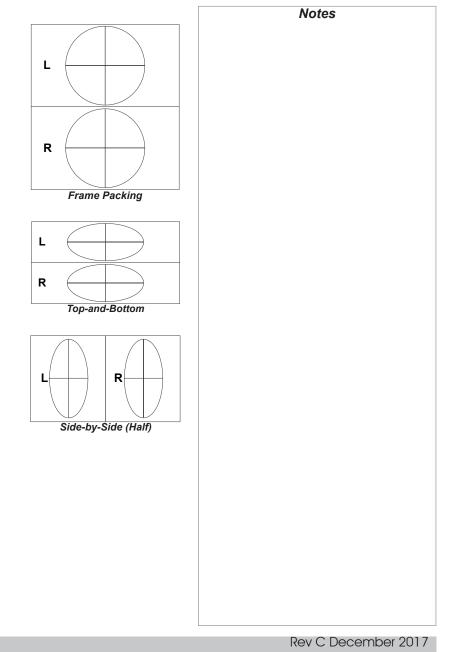

For sequential 3D, an external sync is required to identify left and right frames. If no sync is available from the sequential source, the projector will generate an output sync, but it may then be necessary to manually reset the dominance each time the player is started.

Processing through the projector is limited 60Hz. Therefore while 120Hz sequential or Dual Pipe can be accepted and displayed it will drop to 60Hz for processing and then frame double after processing.

• Frame Packing

This format will be detected, re-synchronised, frame-multiplied and displayed at 96 Hz with the left eye / right eye dominance automatically extracted from the video data. You need to optimize **Dark Time** and **Sync Delay** manually to suit your chosen switching glasses.

• Top and Bottom

Sets the projector to reformat the video frames and map them to the display with the left eye / right eye dominance automatically extracted from the video data. You need to optimize **Dark Time** and **Sync Delay** manually to suit your chosen switching glasses.

• Side by Side (Half): interlaced and progressive, 50 and 60Hz The side-by-side image will be de-interlaced (if appropriate), resized and then sequentially displayed at

100 or 120 Hz. The left eye / right eye dominance will be automatically extracted from the video data, however you will need to optimize **Dark Time** and **Sync Delay** manually to suit your chosen switching glasses.

Dark Time and Sync Delay need to be set only once, to optimize the image for the glasses in use.

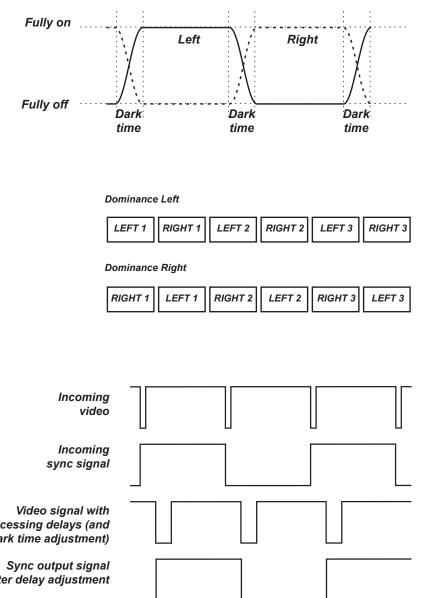

USING THE PROJECTOR

Some 3D settings explained

Dark Time

Banding can be caused if the image is displayed before each eye of the 3D switching glasses or ZScreen is not fully open. Dark Time allows you to minimize this effect.

In order to achieve maximum light output and a smooth grayscale, whilst eliminating ghosting, the following procedure is recommended:

Notes

- 1. Set **Dark Time** to a value appropriate to the glasses or ZScreen, say 1.3 ms or 1.95 ms.
- 2. Adjust Sync Offset time to eliminate ghosting and achieve a smooth grayscale.
- 3. Repeat steps 1 and 2 until the best result is obtained.

Eye Swap

The outgoing 3D frames are in pairs - the dominant frame being presented first. You can determine which frame should be the dominant one.

By convention the default setting is Left.

Sync Offset

the frames generated by its graphics card. However, to compensate for switching delays in the glasses or ZScreen, Sync Offset is used to adjust the sync output signal sent to the ZScreen or 3D glasses to minimise overlapping (ghosting in the image when viewed through the 3D glasses

> processing delays (and dark time adjustment) after delay adjustment

Operating Guide

Rev C December 2017

Laser menu

• Power Mode

- **Eco** will automatically set the laser power to 80%.
- **Normal** will set the power to 100%.
- Set to **Custom** if you wish to adjust the power manually.

• Power Level

This setting is only available if **Power Mode** is set to **Custom**.

Choose a value between 20 and 100, ranging from 20% to 100% laser power.

• Constant Brightness

Once a **Custom** brightness has been set, then **Constant Brightness** can be turned **ON**. This setting will maintain the brightness until the maximum laser power has been reached. The lower the power level the longer it will be maintained.

Power Mode Normal Power Level — — — —
ower Level — — — —
Constant Brightness Off

Setup menu

Orientation

Choose from Front Tabletop, Front Ceiling, Rear Tabletop, Rear Ceiling and Auto-front..

• High Altitude Choose from On, Auto and Quiet.

Standby Mode

Choose from SuperECO, ECO and Normal.

SuperECO uses minimal power and disables power ON via LAN. **ECO** uses a low power setting but enables power ON via Ethernet port only. **Normal** enables power ON via both HDBase-T/LAN and Ethernet ports.

Screen Setting

Choose from 16:10, 16:9 and 4:3.

ColorMax Setting
 Set up user-defined color gamut values.

• Power On/Off

Access the submenu to set up automatic projector power on and power off.

Clock Adjust

Access the submenu to set current date and local time.

Startup Logo

Set this to **On** if you want the DP logo to show when the projector is first switched on.

Blank Screen

Choose from Logo, Black, Blue and White.

• Auto Source

If this setting is **On**, the projector will automatically search for an active input source.

• OSD Settings

Access this submenu to adjust the appearance and position of the on-screen display.

Highlight the **DOWN** \checkmark arrow at the bottom of the page and press **ENTER/OK** to navigate to the second **Setup** menu page.

	Setup			
Orientation High Altitude Standby Mode Screen Setting ColorMax Setting Power On/Off Clock Adjust Startup Logo Blank Screen Auto Source OSD Settings	Setup	Auto-front Auto SuperECO 16:9 On Logo Off	• •	Aut the orie
	▼		Þ	

Notes

Auto-front automatically detects the projector's position and sets the orientation accordingly.

• Trigger1 and Trigger 2

Choose from Screen, 5:4, 4:3, 16:10, 16:9, 1.88, 2.35, TheaterScope, Source, Unscaled or RS232 to determine what will cause each trigger output to activate.

• Infrared Remote

Set to **Off** if you wish to disable the remote control.

• IR Code

The projector and the remote control need a matching IR code: a two-digit number between *00* and *99*.

The default IR code is **00**. This is also a master code, which, if assigned to a remote, will work regardless of the value assigned to the projector.

To assign an IR code for the projector:

- 1. Select IR Code.
- 2. Use the **UP** \blacktriangle and **DOWN** \blacktriangledown arrow buttons to change the values.

To assign an IR code for the remote:

- 1. Press and hold the ADDR button on the remote until the indicator starts flashing.
- Release the ADDR button and while the indicator is still flashing, enter a twodigit address using the numeric input buttons. The indicator will flash three times quickly to confirm the change.

• IR Code Reset

Use this command to unassign an IR code from the projector. This will revert the **IR Code** value to 00.

To unassign an IR code from the remote control,

- Press and hold **ALT** and **ADDR** simultaneously until the indicator flashes to confirm the change.
- Memory

Access this submenu to save up to four presets containing custom combinations of image settings, or to recall a saved preset.

Image Latency

Choose either Normal or Fast.

Fast offers reduced latency for both 2D and 3D sources. **Normal** should be used in cases where large amounts of geometry or warp have been applied.

Highlight the **UP** ▲ arrow at the top of the page and press **ENTER/OK** to go back to the first **Setup** menu page.

			Notes

Infrared Remote	On		you can only turn it back on again from the control panel or via the
IR Code	0		Projector Controller application.
IR Code Reset			The Projector Controller software
Memory Image Latency	Normal	•	is available for download from the Digital Projection website, free of charge.
			A wired remote control will also be disabled if Infrared Remote is set to Off.

Measured Data

Target Data - User 1

Target Data – User 2

Setup menu continued from previous page

ColorMax Setting

ColorMax Setting permits seven point color matching of red, green, blue, yellow, cyan, magenta and white.

You can enter your own gamut values here, or edit values you have imported using the Projector Controller software.

Defining your own colorspace with individual x and y coordinates for each color enables you to match not only the whites but each individual color as well.

Highlight the submenu you wish to open and press ENTER/OK to confirm your choice.

Measured Data / Target Data

1. Use the **UP** \blacktriangle and **DOWN** \checkmark arrow buttons to highlight a color, then use the LEFT \triangleleft and RIGHT arrow buttons to navigate to the x or v coordinate.

- 2. Use the **UP** \blacktriangle and **DOWN** \blacktriangledown arrow buttons to increase and decrease the value, respectively.
- 3. Exit edit mode:
 - press ENTER/OK, if you want to save the edited values.
 - press EXIT, if you do not wish • to save the edited values
- 4. If necessary, highlight another color and repeat the procedure.

Ν	leasured Data

ColorMax

The Projector Controller software is available for download from the Digital Projection website, free of charge. This tool is best used in conjunction with a specialized light meter (a photo spectrometer) to measure

Notes

color parameters within a particular installation. However, the preloaded generic factory default data set is designed to give more than satisfactory results.

Power On/Off

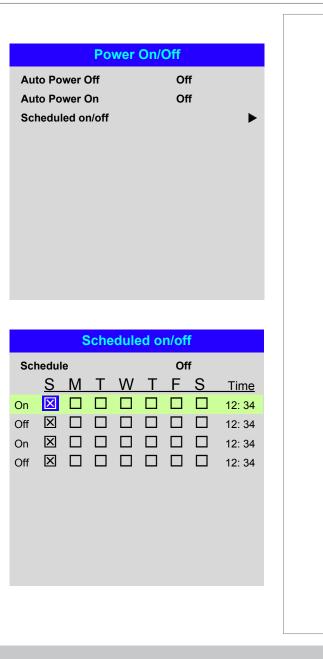

Auto Power Off

Set this to On if you want the projector to go into STANDBY mode when no input source is detected for 20 minutes.

Auto Power On

Set this to \mathbf{On} if you want the projector to start up immediately when the mains is connected.

Set this to **Off** if you want the projector to go into STANDBY mode when the mains is connected. In this case, the projector will not start up until the **POWER** button is pressed on the control panel or the **ON** button is pressed on the remote control.

Scheduled on/off

Access this submenu to create a weekly schedule for automatic on and off times:

- 1. Set a schedule:
 - Use the UP ▲ and DOWN ▼ arrow buttons to highlight a row, then press ENTER/OK to enable edit mode.
 - Within a row, navigate with the **LEFT** ◄ and **RIGHT** ► arrow buttons. Set values with the **UP** ▲ and **DOWN** ▼ arrow buttons.
 - To exit edit mode, press ENTER/OK. Alternatively, press EXIT if you don't want the changes to take effect. Move to another row using the UP ▲ and DOWN ▼ arrow buttons.
- 2. To enable the schedule, set **Schedule** to **On**.

Clock Adjust

Use this menu to set date (in **dd:MM:yyyy** format), time (in **HH:mm** format) and time zone.

The date and time set here will affect any schedule created within the **Power On/Off** menu.

Clock Adju	st
Date (dd:MM:yyyy) Time (HH:mm) Time Zone	20:11:2015 14:00 UTC 0

OSD Settings

- Language sets the OSD language.
- **Menu Position** determines where the OSD should appear on the screen when activated.
- **Menu Transparency** sets OSD transparency between **0%** (no transparency), **25%**, **50%** and **75%**.
- **Time Out** determines how long the OSD should remain on screen if no buttons are pressed. Choose **Always On** to disable this feature.
- **Message Box** determines whether projector status messages should appear on the screen.

Memory

The current image settings can be saved as a preset, which you can recall later. The default settings can be recalled at any time as well.

Up to four custom presets can be stored for each input.

The following settings are saved in a preset:

- From the Image menu Dynamic Black, Gamma, Brightness, Contrast, Saturation, Hue, Sharpness and Noise Reduction
- From the Color menu Color Space, Color Mode, ColorMax, Color Temperature, RGB Lift and RGB Gain
- From the Geometry menu Aspect Ratio and Overscan
- From the **3D** Menu **3D Format, DLPLink, Sync, Dark Time, Sync Offset**

To recall a saved preset:

 Select Recall Memory and press ENTER/OK, then select a preset from Preset A to Preset D. Select Default to load factory default values.

To save a preset:

• Select Save Settings and press ENTER/OK, then choose from Preset A, Preset B, Preset C and Preset D.

Choosing A Lens

A number of lenses are available. Which lens you choose depends on the screen size, image aspect ratio, throw distance and light output.

The following table shows all available lenses in order of their *throw ratios*:

Throw ratios	Focus range	Lens shift
1.20 - 1.56 : 1 zoom	1 m - 8 m	V: 0.5 (U) 0.5 (D) frame H: 0.15 (L) 0.15 (R) frame
1.50 - 2.00 : 1 zoom	2 m - 12 m	V: 0.5 (U) 0.3 (D) frame H: 0.15 (L) 0.15 (R) frame
2.00 - 4.00 : 1 zoom	2.5 m - 15 m	V: 0.5 (U) 0.3 (D) frame H: 0.15 (L) 0.15 (R) frame
4.00 - 7.00 : 1 zoom	4 m - 42 m	V: 0.5 (U) 0.3 (D) frame H: 0.15 (L) 0.15 (R) frame

To choose a lens, calculate the *throw ratio* required.

Notes Throw distance calculations are based on the distance from the outer end of the lens, which will vary from lens to lens. The distance between the front of the projector chassis and the outer end of the lens is called **lens** extension. Lens extensions is measured when the lens is focused at infinity, and fully extended. Refer to the projector CAD drawings for individual lens extension figures. For information about individual lens part numbers, see Appendix A at the end of this document.

CHOOSING A LENS

Identify the required lens by calculating the throw ratio.

A *throw ratio* is the ratio of the throw distance to the screen width:

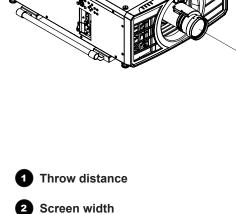

Throw ratio = Throw distance

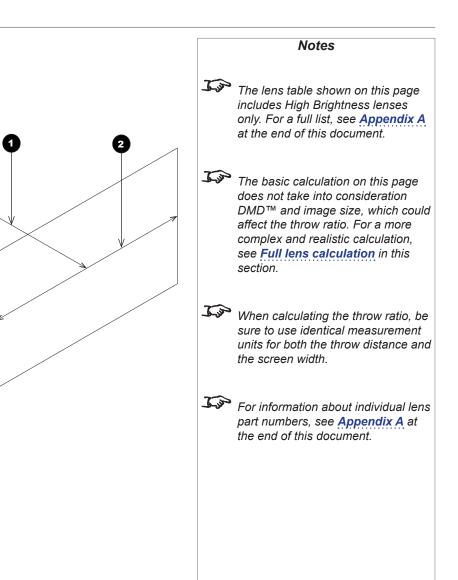

Screen width

- 1. Use the formula above to obtain the required throw ratio.
- 2. Match the throw ratio with a lens from the table below:

Throw ratios	Focus range
1.20 - 1.56 : 1 zoom	1 m - 8 m
1.50 - 2.00 : 1 zoom	2 m - 12 m
2.00 - 4.00 : 1 zoom	2.5 m - 15 m
4.00 - 7.00 : 1 zoom	4 m - 42 m

3. Ensure the required throw distance is within the range covered by the lens.

Rev C December 2017

Basic calculation example

CHOOSING A LENS

1. Calculate the throw ratio using the formula.

Your screen is 4.5 m wide and you wish to place the projector approximately 10 m from the screen. The throw ratio will then be

11 = **2.22**

4.5

2. Match the result with the lens table.

The lens matching a throw ratio of 2.22 is *the 2.00 - 4.00 : 1 zoom lens*.

3. Check whether the lens covers the required throw distance.

The focus range quoted for the 2.00 - 4.00 : 1 zoom lens is **2.5 - 15** *m*. The required distance of 10 m is within the range.

INFORMATION YOU NEED FOR THIS CALCULATION

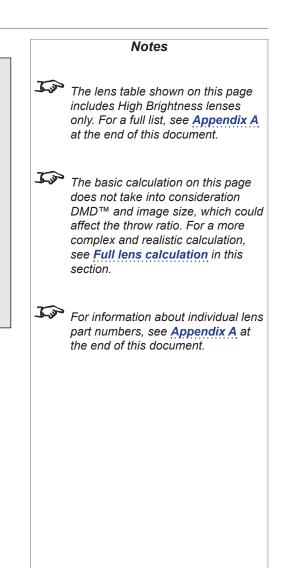

• The throw ratio formula:

Throw ratio = Throw distance

Screen width

• The lens table:

Throw ratios	Focus range
1.20 - 1.56 : 1 zoom	1 m - 8 m
1.50 - 2.00 : 1 zoom	2 m - 12 m
2.00 - 4.00 : 1 zoom	2.5 m - 15 m
4.00 - 7.00 : 1 zoom	4 m - 42 m

Full lens calculation

Introducing TRC

The choice of lens will affect the image size and will address discrepancies between the DMD^{TM} resolution and the source.

When an image fills the height of the DMDTM but not the width, it uses less than 100% of the DMDTM surface. A lens chosen using the basic formula may produce an image that is considerably smaller than the actual screen.

To compensate for loss of screen space in such situations, you need to increase the throw ratio using a *Throw Ratio Correction (TRC)*.

Example

Fig. 1 illustrates a 4:3 image within a WUXGA DMD[™].

When a WUXGA projector is used for a 4:3 image, the image does not fill the width of the DMD[™], creating a *pillarboxing* effect - blank spaces to the left and right.

Fig. 2 shows the same image projected on a 4:3 screen using a standard lens (chosen with the basic calculation).

The DMD[™] accurately fills the width of the screen; however, the pillarboxing is now part of the projected image and is transferred to the screen.

The DMDTM does not fill the height of the screen, which has caused *letterboxing* - further blank spaces at the top and bottom of the screen.

The image is now surrounded by blank space, which can be removed if the throw ratio is increased.

Fig. 3 shows the image projected on the same screen with a lens chosen using TRC.

The increased throw ratio has allowed the 4:3 image to fill the 4:3 screen seamlessly.

Fig. 2

Notes

TRC can only be applied if greater than 1. If TRC is 1 or less, disregard it and calculate the throw ratio using the basic formula.

Rev C December 2017

Calculating TRC

To calculate TRC, use the following formula:

TRC = 1.6 (DMD™ aspect ratio)

Source aspect ratio

TRC table

Alternatively, you can save time by referencing the following table, which shows the TRC value for some popular image formats:

2.35:1 (Scope), 1920 x 817 pixels	TRC < 1, not used
1.85:1 (Flat), 1920 x 1037 pixels	TRC < 1, not used
1.78:1 (16:9), 1920 x 1080	TRC < 1, not used
1.66:1 (Vista), 1792 x 1080 pixels	TRC < 1, not used
1.6:1 (16:10), 1728 x 1080 pixels	TRC = 1, not used (native resolution)
1.33:1 (4:3), 1440 x 1080 pixels	TRC = 1.2
1.25:1 (5:4), 1350 x 1080 pixels	TRC = 1.28

Notes
TRC can only be applied if greater than 1. If TRC is 1 or less, disregard it and calculate the throw ratio using the basic formula.

Calculating the throw ratio with TRC

- 1. For TRC > 1, amend the basic throw ratio formula as follows:
 - Throw ratio = Throw distance

Screen width x TRC

2. Once a throw ratio is established, identify the matching lens from the table:

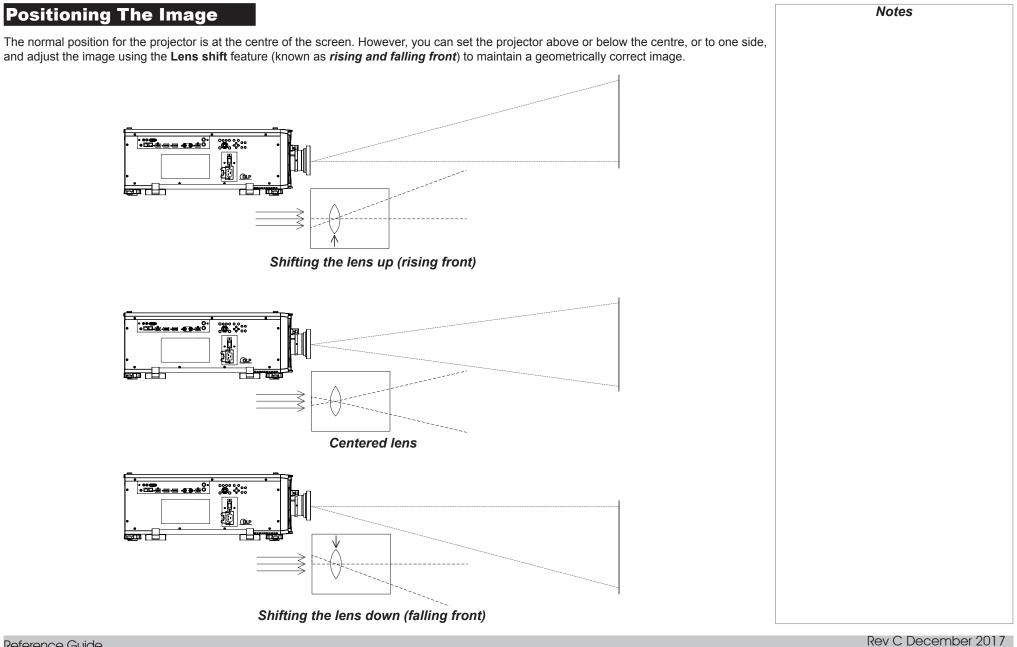

Throw ratios	Focus range				
1.20 - 1.56 : 1 zoom	1 m - 8 m				
1.50 - 2.00 : 1 zoom	2 m - 12 m				
2.00 - 4.00 : 1 zoom	2.5 m - 15 m				
4.00 - 7.00 : 1 zoom	4 m - 42 m				

3. Ensure the required throw distance is within the range of the matching lens.

	Notes
<u>Fo</u>	The lens table shown on this page includes High Brightness lenses only. For a full list, see Appendix A at the end of this document.
<u>L'a</u> r	TRC can only be applied if greater than 1. If TRC is 1 or less, disregard it and calculate the throw ratio using the basic formula.

CHOOSING A LENS

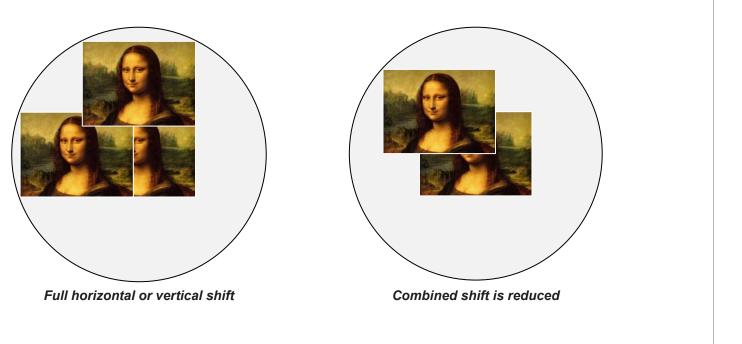

Full lens calculation example	Notes
Your screen is 4.5 m wide; you wish to place the projector approximately 10 m from the screen. The source is 4:3. 1. Calculate TRC as follows: TRC = 1.6 = 1.2 INFORMATION YOU NEED FOR THESE CALCULATIONS $TRC = DMD^{TM}$ aspect ratio Source aspect ratio	The lens table shown on this page includes High Brightness lenses only. For a full list, see <u>Appendix A</u> at the end of this document.
$\frac{1}{7.33}$ 2. Calculate the throw ratio: Throw ratio = 10 = 1.85 4.5×7.2 3. Find a match in the lens table. The table shows that the matching lens is the 1.50 - 2.00 : 1 zoom lens. 4. Check whether the lens covers the required throw distance. The focus range quoted for the 1.50 - 2.00 : 1 zoom lens is 2 - 12 m. The required distance of 10 m is within the range. The table shows ratio = Throw distance The throw ratio formula TRC not used 1.6:1 (Vista) TRC not used 1.6:1 (Vista) TRC not used 1.6:1 (Vista) TRC not used 1.6:1 (16:10) TRC not used 1.6:1 (10) TRC not used 1.20: 1.20	

Reference Guide

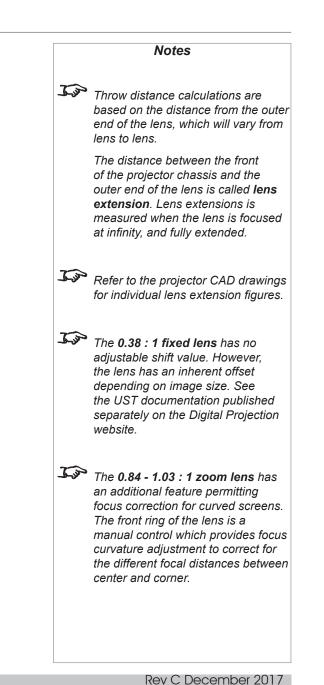

Any single adjustment outside the ranges specified on the following page may result in an unacceptable level of distortion, particularly at the corners of the image, due to the image passing through the periphery of the lens optics.

If the lens is to be shifted in two directions combined, the maximum range without distortion will be somewhat less, as can be seen in the illustrations below.

Appendix A: Lens Part Numbers

Throw ratios	Part number	Focus range	Lens shift
0.84-1.03:1	114-313	1.5m - 10m	V: 0.37 (U) 0.37 (D) frame H: 0.12 (L) 0.12 (R) frame
1.20 - 1.56 : 1 zoom	117-573	1 m - 8 m	V: 0.5 (U) 0.5 (D) frame H: 0.15 (L) 0.15 (R) frame
1.50 - 2.00 : 1 zoom	118-578	2 m - 12 m	V: 0.5 (U) 0.3 (D) frame H: 0.15 (L) 0.15 (R) frame
2.00 - 4.00 : 1 zoom	118-588	2.5 m - 15 m	V: 0.5 (U) 0.3 (D) frame H: 0.15 (L) 0.15 (R) frame
4.00 - 7.00 : 1 zoom	117-483	4 m - 42 m	V: 0.5 (U) 0.3 (D) frame H: 0.15 (L) 0.15 (R) frame

Appendix D: Glossary Of Term	S
-------------------------------------	---

1080p

An HDTV resolution which corresponds to 1920 x 1080 pixels (a widescreen aspect ratio of 16:9).

3D active glasses

Wireless battery-powered glasses with LCD shutters. Synchronization information is communicated to the glasses by means of an infrared (IR) or radio frequency (RF) emitter which is connected to the Sync Out terminal on the projector. IR or RF pulses are transmitted by the emitter to signal when the left eye and right eye images are being displayed. The glasses incorporate a sensor which detects the emitter's signal and synchronises the left and right eye shutters with the projected image.

3D passive glasses

Passive glasses do not require a power source to work. Light with left-hand polarisation can pass through the left lens and light with righthand polarisation can pass through the right-hand lens. These glasses are used in conjunction with another device which polarizes the image, such as a **ZScreen**.

Adjust lines

A pattern applied to the image where its edge is to be blended with another image. Adjust lines are used to position the projectors in the array during the *edge blend* process.

Anamorphic lens

A special lens which, when used with the *TheaterScope aspect ratio*, allows watching 2.35:1 content packed in a 16:9 source.

Aperture

The opening of the lens that determines the angle through which light travels to come into focus.

Aspect ratio	Notes
The proportional relationship between the width and the height of the projected image. It is represented by two numbers separated by a colon, indicating the ratio of image width and height respectively: for example, 16:9 or 2.35:1.	
Not to be confused with <i>resolution</i> .	
Blanking (projection)	
The ability to intentionally turn off, that is, set to black, areas around the edges of the projected image. It is sometimes referred to as "curtains" since it can be used to blank an area of image that literally falls on the curtains at the side of the screen in a movie theater. Usually no image resizing or geometric correction takes place and the "blanked" part of the image is lost.	
Not to be confused with horizontal and vertical <i>blanking (video signal)</i> .	
Blanking (video signal)	
The section of the video signal where there is no active video data.	
Not to be confused with <i>blanking (projection)</i> .	
Blend region	
The area of the image that is to overlap with another image in an edge blend setup. Sometimes called overlapping region.	
Brightness (electronic control)	
A control which adds a fixed intensity value to every <i>pixel</i> in the display, moving the entire range of displayed intensities up or down, and is used to set the black point in the image (see <i>Contrast</i>). In <i>Component Video</i> signals, brightness is the same as <i>luminance</i> .	
Brightness (optical)	
Describes how 'bright' an image that is projected onto a screen appears to an observer.	
С	
See Chrominance.	

Chrominance

Also known as 'C', this is the component, or pair of components, of a Component Video signal which describes color difference information.

Color difference

In *Component Video* signals, the difference between specified colors and the *luminance* component. Color difference is zero for monochrome images.

Color gamut

The spectrum of color available to be displayed.

Color temperature

The position along the black body curve on the chromaticity diagram, normally quoted in Kelvin. It takes into account the preset values for color balance in the service set-up to take up the variations in the prism. The projector allows you to adjust this temperature (i.e. adjust the picture color temperature).

Component video

A three-wire or four-wire video interface that carries the signal split into its basic **RGB** components or **luminance (brightness)** and two-**colordifference** signals (YUV) and **synchronization** signals.

Contrast (electronic control)

The adjustment of the white point of the image without affecting the black point. This increases the intensity range of the displayed image.

Contrast (optical)

The intensity difference between the darkest and lightest areas of the screen.

Cr, Cb

Color difference signals used with '**Y**' for digital *Component Video* inputs. They provide information about the signal color. Not to be confused with *Pr, Pb*.

Crop

Remove part of the projected image.

Alternatively, fit an image into a frame with a different *aspect ratio* by removing part of the image. The image is resized so that either its length or its width equals the length or width of the frame, while the other dimension has moved outside the frame; the excess area is then cut out.

Dark time

The time inserted between frames when using 3D active glasses, to avoid ghosting caused by switching time between left and right eye.

DDC (Display Data Channel)

A communications link between the source and projector. DDC is used on the HDMI, DVI and VGA inputs. The link is used by the source to read the **EDID** stored in the projector.

Deinterlacing

The process of converting *interlaced* video signals into *progressive* ones.

DHCP (Dynamic Host Configuration Protocol)

A network protocol that is used to configure network devices so that they can communicate on an IP network, for example by allocating an IP address.

DMD[™] (Digital Micromirror Device[™])

The optical tool that transforms the electronic signal from the input source into an optical image projected on the screen. The DMDTM of a projector has a fixed *resolution*, which affects the *aspect ratio* of the projected image.

A Digital Micromirror Device[™] (DMD[™]) consists of moving microscopic mirrors. Each mirror, which acts as a *pixel*, is suspended between two posts by a thin torsion hinge. It can be tilted to produce either a bright or dark pixel.

Edge blend

Reference Guide

A method of creating a combined image by blending the adjoining edges of two or more individual images.

Notes

Remarks:

*1: Based on IT6802 chip specification

*2: Based on IT6535 chip specification

*3: Disable PIP funciton in this situtation

*4: 8-bit / color

*5: Frame drop at scaler and frame doubling at formatter

*6 Output display frame rate up to 96Hz for 24Hz 3D input

Rev C December 2017

Edge tear	Notes
An artifact observed in <i>interlaced video</i> where the screen appears to be split horizontally. Edge tears appear when the video feed is out of sync with the refresh rate of the display device.	
EDID (Extended Display Identification Data)	
Information stored in the projector that can be read by the source.	
EDID is used on the HDMI, DVI and VGA inputs, allowing the source to automatically configure to the optimum display settings.	
EDTV (Enhanced Definition Television)	
A progressive digital television system with a lower resolution than HDTV.	
Field	
In <i>interlaced video</i> , a part of the image <i>frame</i> that is scanned separately. A field is a collection of either all the odd lines or all the even lines within the frame.	
Frame	
One of the many still images displayed in a sequence to create a moving picture. A frame is made of horizontal lines of <i>pixels</i> . For example, a 1920x1080 frame consists of 1080 lines, each containing 1920 pixels. In analog video frames are scanned one at a time (<i>progressive scanning</i>) or split into <i>fields</i> for each field to be scanned separately (<i>interlaced video</i>).	
Frame rate	
The number of <i>frames</i> shown per second (fps). In TV and video, a frame rate is the rate at which the display device scans the screen to "draw" the frame.	
Frame rate multiplication	
To stop low frame rate 3D images from flickering, frame rate multiplication can be used, which increases the displayed frame rate by two or three times.	

Gamma

A nonlinear operation used to code and decode *luminance*. It originates from the Cathode Ray Tube technology used in legacy television sets.

Ghosting

An artifact in 3D image viewing. Ghosting occurs when an image intended for one eye is partially seen by the other eye. Ghosting can be removed by optimizing the *dark time* and sync delay.

HDCP (High-bandwidth Digital Content Protection)

An encryption scheme used to protect video content.

HDTV (High Definition Television)

A television system with a higher *resolution* than *SDTV* and *EDTV*. It can be transmitted in various formats, notably *1080p* and 720p.

Hertz (Hz)

Cycles per second.

Horizontal Scan Rate

The rate at which the lines of the incoming signal are refreshed. The rate is set by the horizontal *synchronization* from the source and measured in *Hertz*.

Hs + Vs

Horizontal and vertical synchronization.

Hue

The graduation (red/green balance) of color (applicable to NTSC).

Interlacing

A method of updating the image. The screen is divided in two *fields*, one containing every odd horizontal line, the other one containing the even lines. The fields are then alternately updated. In analog TV interlacing was commonly used as a way of doubling the refresh rate without consuming extra bandwidth.

Interleaving

The alternation between	left and right eye	images when displaying 3D.
-------------------------	--------------------	----------------------------

LED (Light Emitting Diode)

An electronic component that emits light.

Letterboxing

Black margins at the top and bottom of the image. Letterboxing appears when a wider image is packed into a narrower *frame* without changing the original *aspect ratio*.

Lumen

A photometric unit of radiant power. For projectors, it is normally used to specify the total amount of emitted visible light.

Luminance

Also known as 'Y', this is the part of a Component Video signal which affects the brightness, i.e. the black and white part.

Noise

Electrical interference displayed on the screen.

NTSC (National Television Standards Committee)

The United States standard for television - 525 lines transmitted at 60 interlaced fields per second.

OSD (on-screen display)

The projector menus allowing you to adjust various settings.

Overlapping region

See blend region.

PAL (Phase Alternate Line)

The television system used in the UK, Australia and other countries - 625 lines transmitted at 50 interlaced fields per second.

Pillarboxing

Black margins at the left and right of the image. Pillarboxing appears when a narrower image is packed into a wider *frame* without changing the *aspect ratio*.

Pixel

Short for *Picture Element*. The most basic unit of an image. Pixels are arranged in lines and columns. Each pixel corresponds to a micromirror within the *DMD*[™]; resolutions reflect the number of pixels per line by the number of lines. For example, a <u>1080p</u> projector contains 1080 lines, each consisting of 1920 pixels.

Pond of mirrors

Area around the periphery of the *DMD*TM containing inactive mirrors. The pond of mirrors may cause artifacts, for example during the *edge blending* process.

Pr, Pb

Color difference signals used with '**Y**' for analog **Component Video** inputs. They provide information about the signal color. Not to be confused with **Cr**, **Cb**.

Primary colors

Three colors any two of which cannot be mixed to produce the third. In additive color television systems the primary colors are red, green and blue.

Diaital Projection	M-Vision Laser 18K Series
Digital Tojoonon	

Progressive scanning	Notes
A method of updating the image in which the lines of each <i>frame</i> are drawn in a sequence, without <i>interlacing</i> .	
Pulldown	
The process of converting a 24 fps film footage to a video <i>frame rate</i> (25 fps for <i>PAL/SECAM</i> , 30 fps for <i>NTSC</i>) by adding extra <i>frames</i> . DP projectors automatically carry out reverse pulldown whenever possible.	
Resolution	
The number of <i>pixels</i> in an image, usually represented by the number of pixels per line and the number of lines (for example, 1920 x 1200).	
RGB (Red, Green and Blue)	
An uncompressed Component Video standard.	
Saturation	
The amount of color in an image.	
Scope	
An aspect ratio of 2.35:1.	
SDTV (Standard Definition Television)	
An <i>interlaced</i> television system with a lower <i>resolution</i> than <i>HDTV</i> . For <i>PAL</i> and <i>SECAM</i> signals, the resolution is 576i; for <i>NTSC</i> it is 480i.	
SECAM (Sequential Color with Memory)	
The television system used in France, Russia and some other countries - 625 lines transmitted at 50 <i>interlaced fields</i> per second.	
The television system used in France, russia and some outer countries - 020 intes transmitted at 50 interaced news per second.	
SX+	
A display resolution of 1400 x 1050 pixels with a 4:3 screen aspect ratio. (Shortened from SXGA+, stands for Super Extended Graphics	
Array Plus.)	

Synchronization	Notes
A timing signal used to coordinate an action.	
Test pattern	
A still image specially prepared for testing a projection system. It may contain various combinations of colors, lines and geometric shapes.	
TheaterScope	
An aspect ratio used in conjunction with a special anamorphic lens to display 2.35:1 images packed into a 16:9 frame.	
Throw distance	
The distance between the screen and the projector.	
Throw ratio	
The ratio of the <i>throw distance</i> to the screen width.	
TRC (Throw ratio correction)	
A special number used in calculating <i>throw distances</i> and <i>throw ratios</i> when the image does not fill the width of the <i>DMD</i> ™.	
TRC is the ratio of the <i>DMD</i> TM aspect ratio to the image source aspect ratio:	
TRC = DMD™ aspect ratio	
Source aspect ratio	
TRC is only used in calculations if it is greater than 1.	
UXGA	
A display resolution of 1600 x 1200 pixels with a 4:3 screen aspect ratio. (Stands for Ultra Extended Graphics Array.)	

Vertical Scan Rate

The rate at which the *frames* of the incoming signal are refreshed. The rate is set by the vertical *synchronization* from the source and measured in *Hertz*.

Vignetting

Optical cropping of the image caused by the components in the projection lens. This can happen if too much offset is applied when positioning the image using the lens mount.

Vista

An aspect ratio of 1.66:1.

WUXGA

A display *resolution* of 1920 x 1200 *pixels* with a 16:10 screen *aspect ratio*. (Stands for Widescreen *Ultra Extended Graphics Array.*)

Υ

This is the *luminance* input (*brightness*) from a *Component Video* signal.

YUV

See Pr, Pb.

ZScreen

A special kind of light modulator which polarizes the projected image for 3D viewing. It normally requires that images are projected onto a silver screen. The ZScreen is placed between the projector lens and screen. It changes the polarization of the projected light and switches between left- and right-handed circularly polarized light at the field rate.
